AB The hybrid dyes have the structure XSY, where X represents a chromophoric group that is derived from a direct dye, Y represents a group that is derived from a coupler- or developer-type oxidation dye precursor, an indole derivative as a precursor of melanins, or a direct dye, and S represents a direct bond or a spacer group, provided that S does not represent an alkylene or mono- or polyhydroxyalkylene group if Y is derived from a direct dye. The use of colorants containing these dyes avoids or significantly minimizes a number of problems that occur with the use of complex dye mixts. Thus, 1-[[3-[(4-aminophenyl)amino]propyl]amino]anthraquinone-3HCl (I) was prepared by alkylation of 3-(p-nitroanilino)propylamine with 1-chloroanthraquinone, followed by hydrogenation using 5% Pd on charcoal. A hair cream formulation containing I and 2-(2,4-diaminophenoxy)ethanol was applied to hair and developed with H2O2 solution to provide a bluish gray shade.

AB I, where R is alkylene or cycloalkylene give blue shades on nylon. Thus, Na 1-amino-4-(3-aminopropylamino)anthraquinone-2-sulfonate 6 was treated with Na 1-amino-4-bromoanthraquinone-2-sulfonate 8.35 and water 42 in the presence of NaOH 2.1 and CuSO₄ 0.33 part at 80° for 6 hr to give I[R = (CH₂)₃, X = H], a blue powder, reddish blue on nylon. Similarly prepared were the following I (R, X, and shade on nylon given): (CH₂)₆, H, reddish blue; 1,4-cyclohexylene, H, blue; A, H, reddish blue; (CH₂)₆, SO₃Na, blue.
